The DOT token is used for staking and governance; it can be bought or sold on Coinbase and other exchanges. Polkadot, like many post-Bitcoin cryptocurrencies, is both a token that can be bought or sold via exchanges like Coinbase and a decentralized protocol. The Polkadot protocol is designed to allow unrelated blockchains to securely talk to each other, so that value or data can flow between, say, the Ethereum and Bitcoin blockchains without any intermediary.

Binance futures are crypto futures that enable traders to trade digital currencies without actually possessing the underlying assets. Futures in cryptocurrency work similarly to futures in equities and stock indices. Binance futures derive their future price from the underlying crypto asset, like Bitcoin, Ethereum, Bitcoin Cash, Litecoin, etc.

Futures contracts on Binance are intuitively designed and easy to use, making them ideal for beginners. A key benefit of futures contracts, particularly the USD-margined contracts, is that you can easily calculate their returns in fiat. For example, when you make 500 USDT in profit, you can easily estimate that the profit is worth approximately \$500 - since the value of 1 USDT is pegged closely to 1 USD.
